SUMMARY

Experienced Angular and .NET Core Developer with 6+ years of hands-on experience in designing and developing scalable web applications across domains like GIS Mapping, Healthcare, Transportation, and Enterprise Systems. Strong expertise in building map-based applications, real-time systems, and data-driven platforms using technologies like ASP.NET MVC, .NET Core, Angular, Web APIs, and SQL Server. Proven ability to handle end-to-end development, including system design, backend APIs, and frontend UI, and database management.

Extensive experience working with Google Maps, GeoServer, and GIS-based solutions, enabling dynamic data visualization and location-based filtering. Skilled in integrating third-party services and building responsive, user-friendly interfaces.

Hands-on experience in developing real-time applications using SignalR, healthcare management systems for patient and activity tracking, and transport/logistics platforms for vehicle movement and order management.

Strong understanding of application architecture, performance optimization, and clean coding practices. Capable of working independently as well as in team environments, delivering high-quality solutions within deadlines.

EDUCATION

Gujarat Technological University
Bachelor of Engineering (BE) IT– 2013

TECHNICAL SKILLS

• Frontend Technologies

Angular, TypeScript, JavaScript, HTML5, CSS3, CSS, jQuery

• Backend Technologies

C#, .NET Core (6/7/8), ASP.NET MVC, REST APIs, WCF

Entity Framework, Dapper, ADO.NET, CQRS, Repository Pattern,

• Architecture & Design

Microservices Architecture, Multi-tier Architecture
RBAC (Role-Based Access Control), Performance Optimization, Design Patterns (Factory, Singleton)

• Database

SQL Server, PostgreSQL, SQLite, Azure SQL, Cosmos DB, OracleDB

• Cloud & Tools

Azure (Blob Storage, Key Vault, Functions, AD)
GitHub, Docker, Postman

• AI & Productivity Tools

ChatGPT, GitHub Copilot, Codex, claude

PROFESSIONAL EXPERIENCE

Sr Software Developer

Web Ashlar Software solution Pvt. Ltd

- Designed and developed scalable enterprise applications using .NET Core and Angular
- Built secure REST APIs for financial and business-critical operations
- Implemented multi-tenant and microservices-based architectures
- Integrated third-party APIs including banking, payment, and external services
- Led development teams and mentored junior developers
- Ensured compliance, security, and performance optimization across applications
- Participated in requirement gathering, system design, and stakeholder communication
- Followed Agile methodologies for iterative development and delivery

Project Title: Envision Map

Duration: 3+ Years

Team Size: 2 Developers

Description:

Envision Map is a GIS-based web application designed to manage and visualize different types of data layers on interactive maps and grids. The system enables users to customize map views, apply filters, and analyze location-based data efficiently.

It supports importing multiple file formats to display structured data on maps and provides export functionality for reporting and analysis. The application is widely used for handling geospatial data and improving decision-making through visual insights.

Responsibilities:

- Designed and developed the application using ASP.NET MVC and Angular
 - Implemented map-based visualization using Google Maps and GeoServer
 - Developed Restful Web APIs for data processing and integration
 - Built dynamic UI components for map filtering, layering, and grid display
 - Implemented file import functionality for multiple data formats
 - Developed export features for downloading filtered data
 - Optimized performance for handling large geospatial datasets
 - Integrated backend services with frontend using Angular
 - Handled database design and data management using SQL Server
 - Performed debugging, testing, and performance improvements
-

Key Features:

- Interactive map with multiple data layer support
 - Dynamic filtering and customization of map data
 - Data import functionality for various file formats
 - Grid-based data representation alongside map view
 - Export functionality for reports and filtered data
 - Real-time map updates and data synchronization
 - Scalable architecture for handling large datasets
-

Technologies Utilized:

- ASP.NET MVC 5 – Backend development
 - Angular 6 – Frontend development
 - Web API – Data communication
 - GeoServer – GIS data handling
 - Google Maps API – Map visualization
 - SQL Server – Database management
 - Node.js – Supporting services
-

Achievements:

- Successfully delivered a scalable GIS solution for map-based data analysis
 - Improved data visualization and user experience through interactive UI
 - Optimized system performance for handling large datasets
 - Enabled efficient decision-making using location-based insights
 - Built reusable and maintainable code architecture
-

Project Title: MapSearch 360

Duration: 8 Months

Team Size: 1 Developer

Description:

MapSearch 360 is a directory-based web application designed to manage and display comprehensive information about companies in the energy sector, including petroleum, natural gas, electric power, and renewable energy.

The system stores detailed company data along with their GIS (Geographic Information System) assets, enabling users to search, filter, and analyze company information efficiently. It provides structured data visualization and reporting capabilities to support business insights and decision-making.

Responsibilities:

- Designed and developed the complete application independently
 - Developed backend modules using ASP.NET and Entity Framework
 - Created dynamic UI using JavaScript and Telerik controls
 - Implemented search and filtering functionality for company data
 - Designed and generated reports using Telerik Reporting tools
 - Managed database design and data storage using SQL Server
 - Integrated GIS-related data into the application
 - Ensured performance optimization and smooth data handling
 - Performed testing, debugging, and application enhancements
-

Key Features:

- Directory management for energy sector companies
 - Advanced search and filtering capabilities
 - GIS asset data integration
 - Dynamic reporting using Telerik Reports
 - Structured data storage and retrieval
 - User-friendly interface for data browsing
-

Technologies Utilized:

- ASP.NET – Backend development
 - Telerik Controls & Reports – UI and reporting
 - Entity Framework – ORM for database operations
 - JavaScript – Client-side scripting
 - SQL Server – Database management
-

Achievements:

- Successfully developed and delivered the project independently
- Built efficient search and reporting system for large datasets
- Improved data accessibility and usability for end users
- Delivered a stable and scalable directory system

Project Title: Care System

Duration: 15+ Months

Team Size: 3 Developers

Description:

Care System is a healthcare management application designed to maintain and manage resident (patient) data along with their care plans and daily activities. The system helps healthcare providers monitor resident health, track vital records, and manage care levels efficiently.

It supports scheduling daily activities, recording health vitals, and generating reports for better patient care and decision-making. The system also provides real-time updates and communication features to improve operational efficiency in healthcare environments.

Responsibilities:

- Designed and developed application modules using Angular and .NET Core
 - Implemented real-time features using SignalR for live updates
 - Developed RESTful APIs for managing resident and care data
 - Built responsive UI for managing patient records and activities
 - Implemented scheduling system for daily care activities
 - Managed database design and operations using SQL
 - Integrated AWS services for hosting and scalability
 - Developed reporting features for resident health and activity tracking
 - Ensured secure data handling and proper validation
 - Performed debugging, testing, and performance optimization
-

Key Features:

- Resident (patient) data management system
 - Care level-based planning and tracking
 - Daily activity scheduling and monitoring
 - Vital records tracking and history management
 - Real-time updates using SignalR
 - Reporting and analytics for healthcare data
 - Secure and scalable system architecture
-

Technologies Utilized:

- Angular 11 – Frontend development
 - .NET Core – Backend development
 - SignalR – Real-time communication
 - AWS – Cloud hosting and services
 - SQL Server – Database management
-

Achievements:

- Successfully delivered a reliable healthcare management system
- Improved efficiency in resident care and activity tracking
- Enabled real-time communication for better monitoring
- Built scalable architecture for handling healthcare data
- Enhanced user experience with responsive UI and optimized performance

Project Title: TMS
Duration: 5 Months
Team Size: 1 Developer

Description:

TMS is a vehicle transportation management system that handles order processing and tracks vehicle movement from origin to port and final international destination.

Responsibilities:

- Developed application using Angular and ASP.NET Web API
 - Built responsive UI for web and mobile devices
 - Implemented order and vehicle tracking modules
 - Managed database using SQL Server
 - Performed testing and performance optimization
-

Key Features:

- Vehicle transportation tracking
 - Order management (vendor & fax-based)
 - Responsive design (mobile, tablet, desktop)
 - Data management and tracking
-

Technologies Utilized:

Angular 6, ASP.NET Web API, HTML5, CSS3, Bootstrap, SQL Server, Entity Framework

Achievements:

- Delivered project independently
- Built efficient and responsive transport system

Project Title: JEMS
Duration: 4+ Months
Team Size: 1 Developer

Description:

JEMS is a survey management system for healthcare and emergency services that collects and displays data on maps with location-based filtering for better analysis.

Responsibilities:

- Developed application using ASP.NET MVC
 - Built responsive UI with Bootstrap and JavaScript
 - Implemented map-based data visualization
 - Managed database using SQL Server
 - Handled data filtering and performance optimization
-

Key Features:

- Survey data collection and management
 - Map-based visualization
 - Location-based filtering
 - Multi-city data handling
-

Technologies Utilized:

ASP.NET MVC, Bootstrap, JavaScript, SQL Server

Achievements:

- Delivered project independently
- Improved data visualization and accessibility
